

Next.js Chakra Auth - Project Guide

1. Project Overview

This project is a modern Next.js (App Router) web application featuring a secure Login page and a multi-step Registration flow. It uses Chakra UI for premium styling and React Hook Form with Zod for robust validation.

2. Folder Structure

```
app/  
  page.tsx                (Dashboard / Home)  
  auth/  
    login/page.jsx        (Login Screen)  
    signup/page.jsx       (Multi-step Registration Flow)  
  
components/  
  layout/AuthLayout.jsx   (Split-screen layout with carousel)  
  login/LoginForm.jsx     (Login logic)  
  register/  
    RegisterStart.jsx     (Registration Steps)  
    Registerstepone.jsx  
    Registersteptwo.jsx  
    Registerpassword.jsx  
  
Validation/  
  registerSchema.js       (Zod rules)
```

3. How Login Works

The login page (app/auth/login) uses AuthLayout to display a slick carousel of 3 images on the right. On the left, LoginForm collects the email and password. If the user enters admin@example.com and Password123, it redirects them to the Home Page (app/page.tsx).

4. How Registration Works

The signup process (app/auth/signup) is a Single Page Application that uses URL parameters (?step=START, ?step=IDENTITY, etc.) to navigate.

We wrap all steps in a <FormProvider> so data is remembered across steps. When the user clicks "Continue", we call trigger() from react-hook-form to ensure the Zod schema rules (like valid email, 8-character password) are met before advancing to the next step.
